Dear Hiring Team,

I am excited to apply for the Agentic AI Engineer position at Fervo Energy, a pioneering company that combines proven drilling techniques with AI-native operational capabilities to scale clean geothermal energy. Your mission to build autonomous AI workflows for critical energy operations deeply resonates with my passion and experience in agentic AI and production-grade deployment.

In my role as a Data Science Research Assistant at Example University Applied AI Lab, I developed asynchronous FastAPI services and Python pipelines that support agentic AI workflows and LLM-powered applications, aligning closely with your need for designing and deploying end-to-end agentic AI workflows. I have hands-on experience integrating LangGraph with PyTorch models and FastAPI to enable semantic search and agentic AI capabilities, which parallels your requirements for building reusable components for tool routing, state management, and semantic retrieval pipelines over technical documents and operational data.

Additionally, I built a cybersecurity log anomaly detection agent that combined PyTorch models, semantic incident retrieval, and evidence-linked LLM summaries, demonstrating my ability to create robust retrieval-augmented generation (RAG) systems and agent orchestration. My projects also include a document question-answering system using sentence transformers, FAISS, and FastAPI, which reflects my familiarity with vector databases and retrieval pipelines. I have experience containerizing services with Docker and using Git for version control, supporting your Azure-native deployment and CI/CD expectations. My academic background with an M.S. in Data Science further equips me with the theoretical and practical foundation to contribute effectively to your Data & AI team.

Skills: Python, FastAPI, LangGraph, LangChain, Git, Docker, RAG, FAISS, OpenAI API

Sincerely,

Jordan Lee
