Dear Hiring Team,

I am excited to apply for the Adjunct Faculty - Artificial Intelligence position at Lone Star College-University Park, an institution recognized for innovation and a strong commitment to student access and success.

With a Master of Science in Data Science and experience as a Data Science Research Assistant at Example University Applied AI Lab, I have developed AI-driven educational tools that support adaptive learning and personalized student engagement. This aligns with LSC's focus on innovative learning technologies and student success. My work involved creating AI models using PyTorch and scikit-learn, which facilitated interdisciplinary teaching and collaborative learning environments, directly supporting the teaching and course development responsibilities of this role.

Additionally, I have hands-on experience developing an adaptive AI tutoring assistant that combined retrieval-augmented generation, student mastery tracking, and personalized practice recommendations grounded in approved course content. This project demonstrates my ability to design student-engagement strategies and use learning technologies effectively, which are key skills sought by Lone Star College. My background in creating reusable data-validation checks and educational pipelines further supports my capability to evaluate student progress and advise learners effectively.

Skills: Python, PyTorch, scikit-learn

Sincerely,

Jordan Lee
